so, how to convert it? A: UnRAR is not capable of extracting rar files and its non-standard, not very user-friendly interface, which is responsible for its many problems. Instead, you may try a command-line solution, which is more powerful but less user-friendly: `unrar x file.rar -o file.rar` Some tools have issues extracting rar files. In your case, you may try WinRAR, which might do the trick: WinRAR is a File archiver with a command-line interface. It is the most powerful unrar-compatible freeware application. You may also try 7Zip, which is a free, open-source, and easy-to-use file archiving software: Designed to provide a simple, intuitive interface for users to easily extract RAR files. You should also see this answer for more options. Q: Is it possible to use variables as enumerable types in JavaScript? I'm learning JavaScript and one of the concepts is how to define enumerable types for arrays. I'm wondering if it is possible to use a variable as an enumerable type, much like `var x = 'hi' var y = 'how are you?' var list1 = ['x', 'y'] var list2 = y.split(' ') console.log(list1) // ['x', 'y'] console.log(list2) // ['hi','how are you?']` Essentially, when trying to define a variable as an enumerable type, I am wondering if the following is invalid: `var x = 'hi' var y = 'how are you?' var list1 = ['x', 'y'] // not allowed to use string here var list2 = y.split(' ') // not allowed to use string here console.log(list1) // should I throw a Error here?` I've read this and couldn't find a satisfactory answer. A: You could simply wrap it inside an object and use it as a proper property on that object : `var myEnumObject = { "x": "x", "y`

More than 130 pages of useful and interesting videos related to sailing, boating and fishing, just for you!! SailingSports® is the name of a series of videos focused on boating and fishing videos. All of them are produced by fishermen and boaters, for fishermen and boaters, with the help of the most experienced skippers: Fred Liguori and Pete Briskey. In this video you'll find the most important navigation and navigation equipment such as GPS, chartplotters, radars, DR's, autopilots, GPS receivers, boat plotters, autohelm and more. No other channel/website has a selection of videos equal to SailingSports! If you are interested in any of the equipment featured in the videos, or you want to see any of the topics discussed, then it is easy for you to contact us! Just click on one of the following links to get to our special forum: For sailors and boaters : e79caf774b

Hoshi no Koridoru Is there a way to select all the characters that have the same first name as the current character in a game of Go? For example, if I am playing a game of Go against a black or white stone, it would be great to only select black and white stones for the rest of the game, assuming I have some kind of control over what stones the computer uses for the rest of the game. I have seen a few apps do this, including Palindrome Go, Bonsai, and so forth. A: In Visual Studio select the text and select Edit->Smart Indent, then type in a space. Finally, select Edit->Merge Indents. Visual Studio will automatically indent all of the lines indented by your soft-indentation. Q: How to debug why XSL-FO documents are printed as plain text I'm creating an XSL-FO document using Apache FOP, with the sole purpose of printing it. FOP is configured to use an embedded Apache Tika to identify the document type. The document is returned as a ByteArrayOutputStream instead of as an InputStream. This causes the stream to be encoded as UTF-8. This is fine, but when the ByteArrayOutputStream is displayed, it's rendered as plain text instead of being in a

typeface. I believe this is a pure Apache FOP problem; I'm using the latest version of FOP 1.0. Is there a way to attach a debugger to FOP during execution and watch it as it renders each of the output streams? A: Consider using Saxon as your JVM's "plug-in" for XML tools (this is the class that converts HTML into XML documents, for example). I use Saxon to edit XSLT documents, and it reliably allows me to see what it is doing when it writes a serialized JavaBean. Saxon's documentation has a decent tutorial for this. With Saxon, the XML input is written to a `PrintStream` object that you can observe, and you'll see the calls made to FOP. Another option is to use a Java debugger. This is similar to attaching a debugger to a process when you run it in a window. The debugger looks at all of the methods and calls made by your code, so you should be able to easily get to the point where F
